Chatbot based on stored data

Technologies: Machine Learning (AI/ML), Python, Flask. OpenAI ChatGPT.

Business Requirement: The chatbot is working on the data, which contains the task assigned to each company employee. The chatbot should be able to understand the meaning of the query and give the appropriate answers.

Features we have implemented:

Our PMS chatbot helps with various tasks like:

1. Sharing info about developers, projects, and technologies.
2. Getting project management, billing, and planning hour details.
3. Spotting less productive developers, available staff, and zero billable hour employees.
4. Showing details of projects based on their mode (hourly, monthly, fixed bid).
5. Finding developers skilled in specific technologies.
6. Identifying highly productive developers and less profitable projects.
7. Offering insights into project management and developer productivity.

Based on Users input from the query, AI/ML logic collaborate with internal data and give you best outcome from existing data.

For instance:

give me planning of hours of Mohit for last 10 month

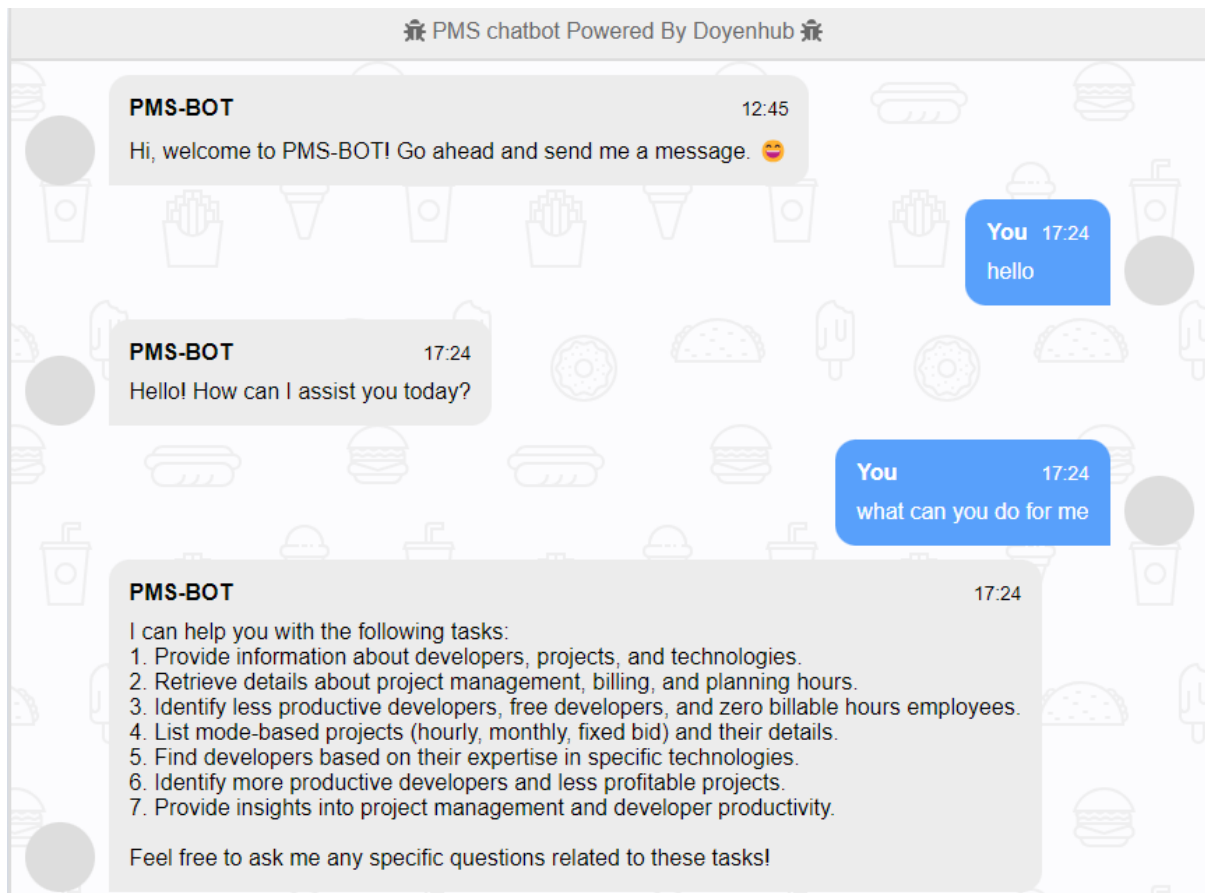

name of
developer

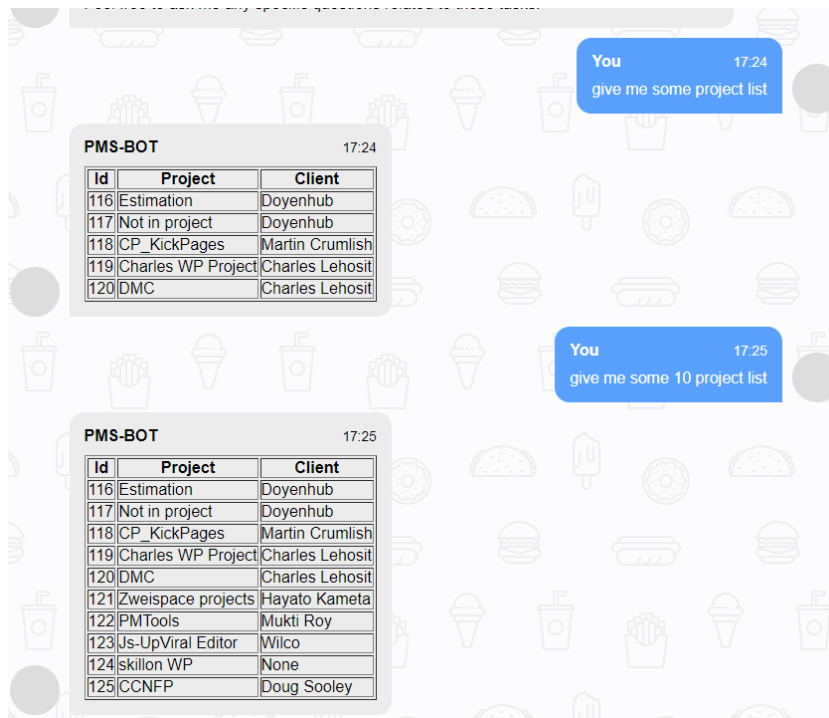

10 number
entries

There will be more assistant questions already give not user for this system.

This comparison helps retrieve the best possible answers, which are then presented to the user.

Getting project list

The screenshot shows a chat interface with a light blue background featuring a repeating pattern of food icons (burgers, fries, ice cream, etc.). A blue message bubble from 'You' at 17:24 says 'give me some project list'. Below it, a grey message bubble from 'PMS-BOT' at 17:24 displays a table with 5 rows of project data. A second blue message bubble from 'You' at 17:25 says 'give me some 10 project list'. Below it, a grey message bubble from 'PMS-BOT' at 17:25 displays a table with 10 rows of project data.

PMS-BOT 17:27
The following individuals worked on the Stripe payment integration:

1. Smit Sanjay Tailor: Smit worked on making a Stripe payment integration demo and also conducted a code review. The date of their involvement was 2023-01-30.
2. Dinal Ishvarbhai Patel: Dinal was responsible for a one-time Stripe payment integration. The date of their involvement was 2023-03-30.
3. Urvi Patel: Urvi worked on integrating CI 4 with Stripe payment elements and conducted research and development on additional payment options like card and Klarna. They also set up CI4 authentication with a hook for user-specific Stripe options. The date of their involvement was 2023-04-06.
4. Kevin Kalpeshbhai Patel: Kevin worked on sending emails on Stripe payment webhooks. They also implemented a feature to identify inactive users based on the last payment date and current date difference. Unfortunately, the date of their involvement is not mentioned.
5. Ranjit Vallabhbhai Katariya: Ranjit checked the configuration of Gravity Forms (GF) with Stripe and compared payments with the Stripe account. The date of their involvement was 2023-03-23.

Sales Data Prediction

Technologies: Python, Machine learning models

Business Requirement:

This involves analyzing past sales data, identifying trends and patterns, and using statistical techniques to forecast future sales. Sales data prediction can be used to identify potential opportunities and risks and optimize business operations and strategies.

Features we have implemented:

- Time Series Analysis:** This involves analysing sales data over a period to identify patterns and trends in the data. Based on the previous data, the program first did the Preprocessing, such as converting day wise the data to Month wise.
- Forecasting:** This involves predicting and displaying future sales based on past data and trends using Linear Regression, RandomForest, and XGBoost models

Linear Regression model

RandomForest model

XGBoost model

Finetune ChatGPT model

Technologies: Python, ChatGPT API, Flask, OpenAI, machine Learning

Business Requirement: The client wants to train the ChatGPT according to their conversation with the client. They have the conversation data and want to train the ChatGPT according to their data.

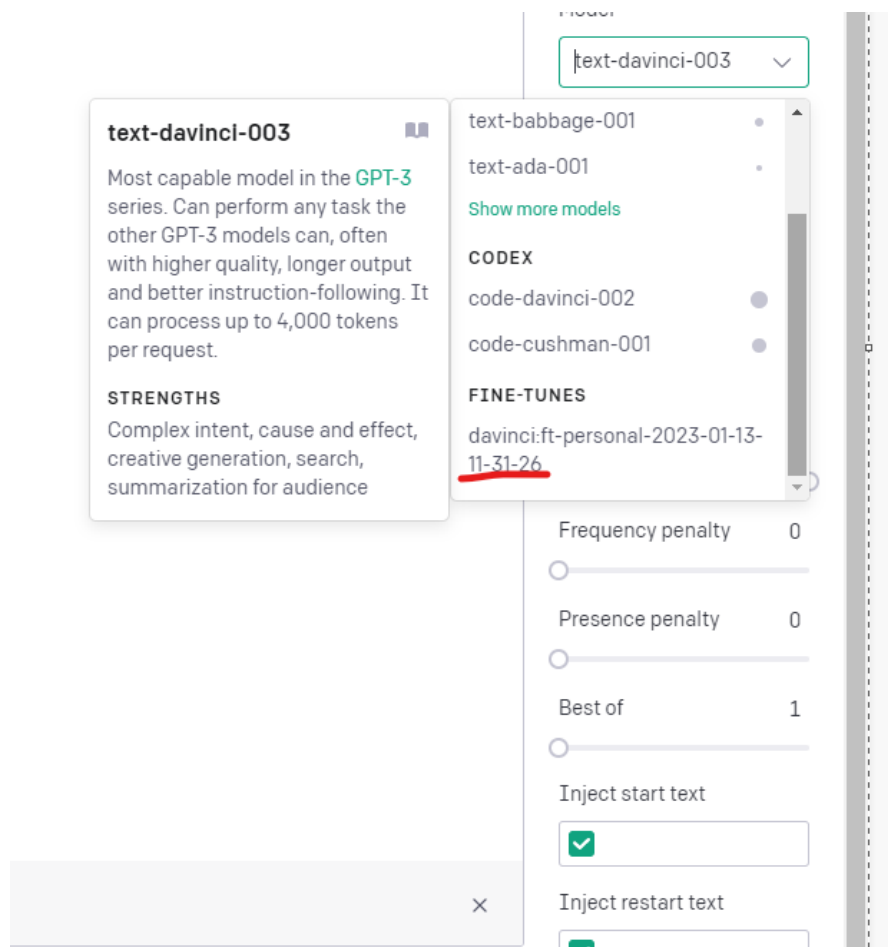

Features we have implemented:

- a. Fine-tune: According to client data the ChatGPT model can be trained and uploaded.

Creating fine-tuned model

```
D:\Doyenhub_work\GPT3_Finetunes-main\GPT3_Finetunes-main\Compassionate_Chatbot>
D:\Doyenhub_work\GPT3_Finetunes-main\GPT3_Finetunes-main\Compassionate_Chatbot>
D:\Doyenhub_work\GPT3_Finetunes-main\GPT3_Finetunes-main\Compassionate_Chatbot>openai tools fine_tunes.prepare_data -f chatbot.jsonl
Analyzing...
- Your file contains 237 prompt-completion pairs
- There are 7 duplicated prompt-completion sets. These are rows: [38, 70, 75, 77, 89, 142, 227]
- All prompts end with suffix '\nEVE:'
WARNING: Some of your prompts contain the suffix '\nEVE:' more than once. We strongly suggest that you review your prompts and add a unique suffix
- Your data does not contain a common ending at the end of your completions. Having a common ending string appended to the end of the completion eases the fine-tuning process. See https://beta.openai.com/docs/guides/fine-tuning/preparing-your-dataset for more examples.

Based on the analysis we will perform the following actions:
```

- b. Provided the simple interface to interact with the newly trained ChatGPT model.

- c. The client can update the model with new conversation data.

YouTube Title and Description generator

Technologies: Python, NLP, ChatGPT, Machine Learning

Business Requirement: In this requirement, the client wanted a robust Python script that could read the files present in a well-defined folder structure and find the important keywords from the files; after finding the script suggested new titles and descriptions for the client's upcoming YouTube videos.

Features we have implemented:

- The user can provide the details to code by using its configuration file.
- The script browses all the folders, reads all files, finds significant words, and creates new files keywords data file containing keywords from the title, description, and keywords.
- The script also creates the word cloud and bar chart to signify each keyword's importance.

Chart from description:

Charts from keywords

Charts from title:

d. The script gives the title and descriptions.

```

"Malware, PDFs, Malicious Analysis & Phishing: Ransomware Explained"

"Malware, PDFs, Malicious Analysis & Phishing: What You Need to Know About Ransomware"

"Malware, PDFs, Malicious Analysis & Phishing Ransomware: What You Need to Know!"

"Malware, Phishing & Ransomware Analysis - How to Protect Yourself from Cyber Attacks"

"Malware, Phishing & Ransomware Analysis: What You Need to Know!"
```

Descriptions.

```
"Malware, Phishing & Ransomware Analysis: What You Need to Know!"

Malware, PDF malicious analysis, phishing, and ransomware are all terms used to describe malicious software or activities that can be used to gain unauthorized access to a computer system or network. Malware is a type of malicious software that is designed to damage, disrupt, or gain access to a computer system or network without the user's knowledge or consent. PDF malicious analysis is a process used to detect and analyze malicious PDF files that are used to spread malware. Phishing is a type of cyber attack that uses social engineering techniques to deceive users into providing sensitive information or clicking malicious links. Ransomware is a type of malicious software that encrypts a user's data and demands a ransom to unlock it. All of these malicious activities can be extremely damaging to a computer system or network, and it is important to be aware of the risks and take steps to protect yourself.

Malware, PDF Malicious Analysis, and Phishing Ransomware are all threats to the security of computer systems and networks. Malware is malicious software that is designed to damage or disable computers, networks, and other systems. PDF Malicious Analysis is a method of analyzing PDF files to identify malicious code and malicious activity. Phishing Ransomware is a type of malware that attempts to extort money from victims by encrypting their data and demanding a ransom payment. All of these threats can be extremely damaging to organizations, so it is important to take the necessary steps to protect against them. This includes using antivirus software, regularly updating systems, and educating employees about cyber security best practices.
```

Stock Market Prediction Using AI/ML

Technologies: Python, ML/AI, long short-term memory (LSTM) artificial neural network, Streamlit Web Framework, Machine Learning

Business Requirement:

The objective of the Stock Price Prediction Software is to provide accurate and reliable predictions of stock prices for various publicly traded companies. This software aims to assist investors, traders, and financial professionals in

making informed decisions by leveraging historical data and advanced algorithms to forecast future stock prices. These questions included:

- a. What would be the price of a stock on the next day?
- b. Which companies show potential for investment?
- c. Which stocks are likely to experience significant price fluctuations?
- d. What are the expected trends and patterns in the stock market?
- e. How can users optimize their investment portfolios based on predicted stock prices?

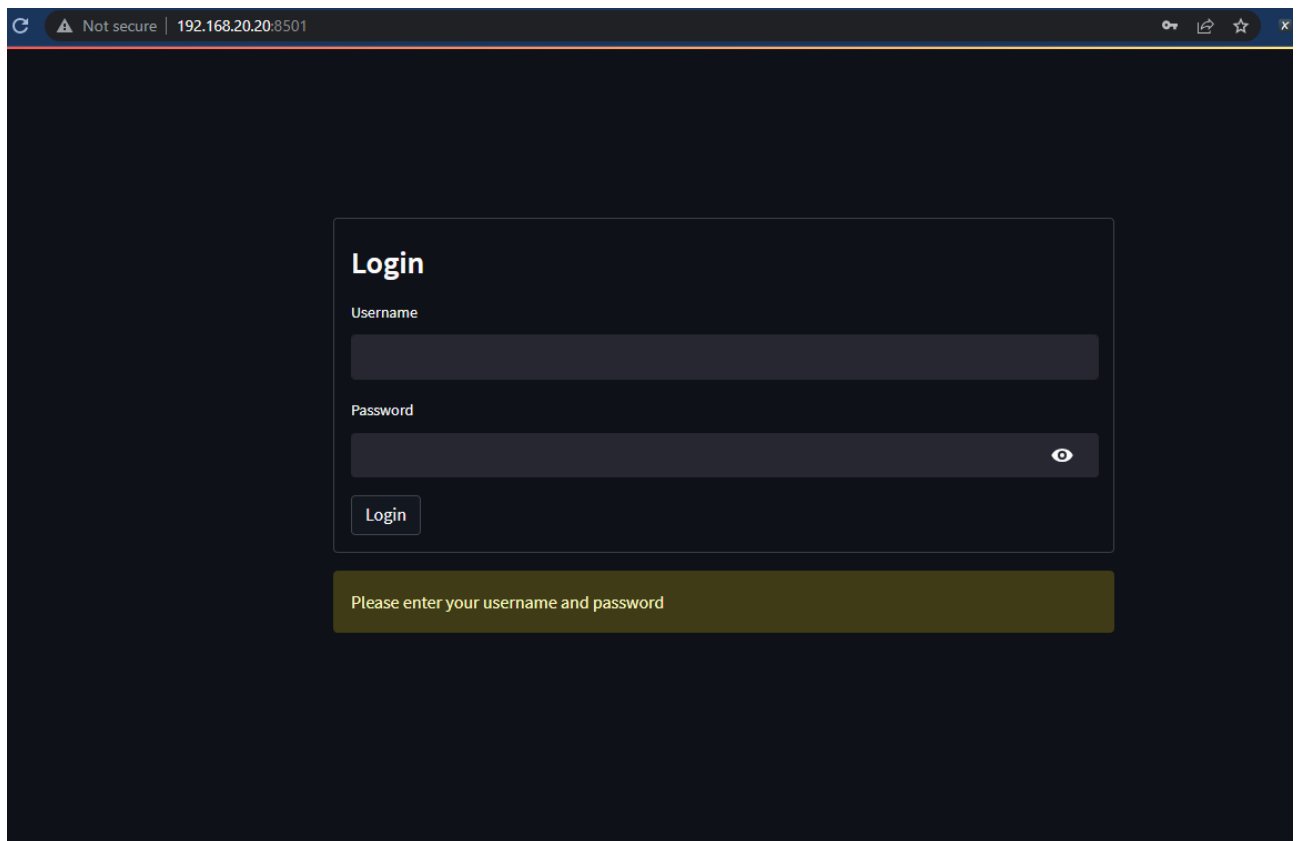

When assessing multiple companies' performance, historical data and seasoned professionals' expertise are crucial, but their limitations become apparent. This problem requires AI software.

AI technology can help companies list and analyse their performance with advanced software solutions. These innovative tools let ordinary users easily access a wealth of financial data by seamlessly integrating AI algorithms and advanced machine learning techniques.

Using historical data, expert predictions, and powerful algorithms, AI software revolutionises multi-company performance assessment. Users can easily access comprehensive information, make informed decisions, and confidently predict future trends. This game-changing technology makes financial analysis accessible to all.

Features we have implemented:

- 1) Login System: Our web-based system provides users with a secure login interface, ensuring that only authorized individuals can access the platform.

- 2) Input Facility: Users are equipped with a user-friendly input interface. They can select the desired start date and end date using calendar options, choose a specific company from a dropdown menu, and input the number of days for the moving

Stock Market Prediction

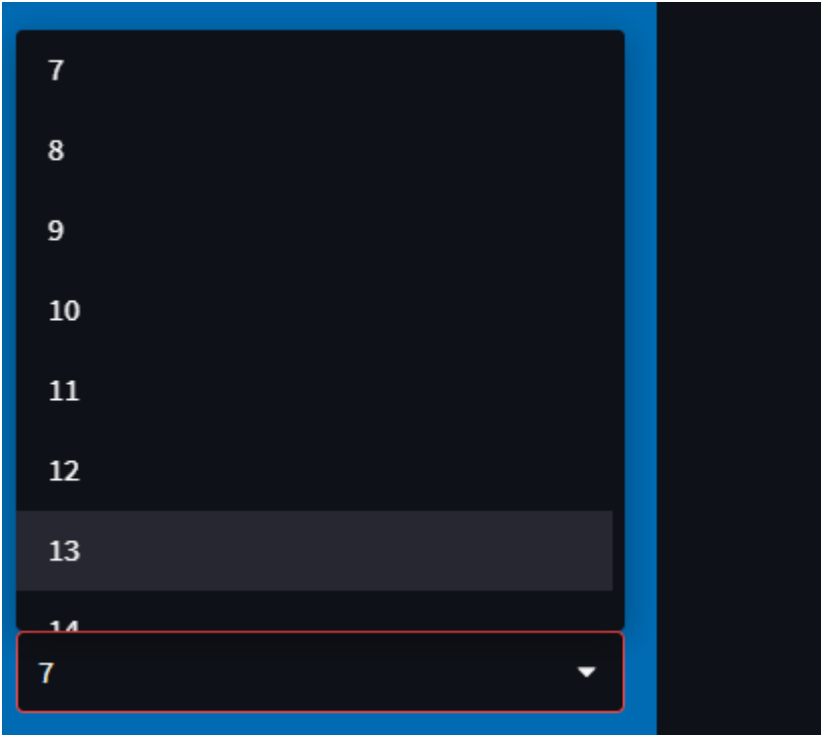

Calendar Option to select dates

Multiple companies list in drop down menu.

Moving average: select from drop down menu day.

3) Historical Data: Our system retrieves historical data from Yahoo Finance, allowing users to analyse and visualize the stock market trends. We provide two types of charts for this purpose:

- a. Candlestick Chart: This chart displays the open, close, high, and low prices for a given time, providing a comprehensive view of price fluctuations.

- b. Line Chart: This chart specifically focuses on the open and close prices, enabling users to track the overall trend of a stock over time.

- 4) Prediction: To assist users in making future projections, we have integrated an LSTM (Long Short-Term Memory) AI model. This model utilizes historical data to forecast potential stock market outcomes. Additionally, we offer three types of Moving Averages, namely:

a. Simple Moving Average (SMA)

b. Exponential Moving Average (EMA)

c. Next as day as moving Average

These moving average techniques provide users with diverse ways to analyse and interpret stock market trends and potential future movements.

By combining the historical data visualization capabilities with the predictive power of our LSTM AI model and various moving average options, our platform equips users with valuable tools to make informed investment decisions and gain insights into market behaviour.

Real Estate Chatbot

Technologies: Python, OpenAI, Flask, Machine Learning

Business Requirement: Client wants AI chatbot API for their Real-estate website. Client to give the facility to users to search the properties using natural language. The AI chatbot must be capable to get the query from the customer and give the appropriate results. The results were to obtain from the client's own property data. The data is scattered in the different tables.

Features we implemented: The chatbot is created by using Langchain and OpenAI functions.

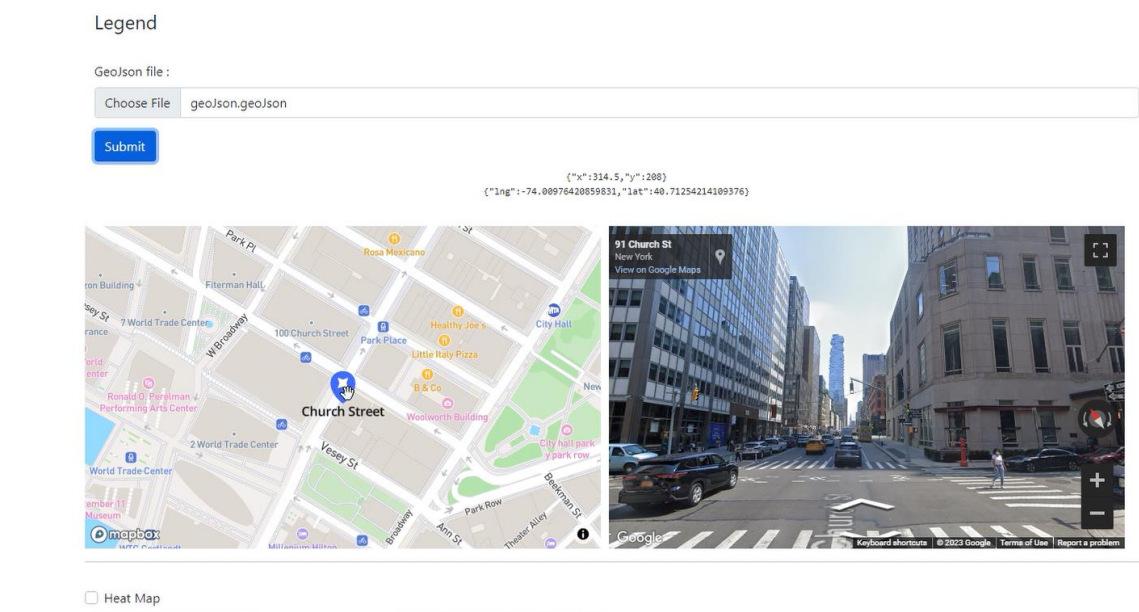

Live Google Street objection detection

Technology: Python, Django, YOLO 8 Object Detection model, Google MAP, Machine Learning, MapBox

Business Requirement: In the requirement client want to map point with heatmap on map box and client want to see Live objection detection on the street view of google map.

Features we implemented: We created the web-based interface using Django, when user uploads the GEOJSON sheet which contains the coordinates with some value the mapbox shows the point.

- a. Once GeoJSON file is upload it shows points on the mapbox.
The point will be mapped google street view.

- b. Multiple points on the MAPbox

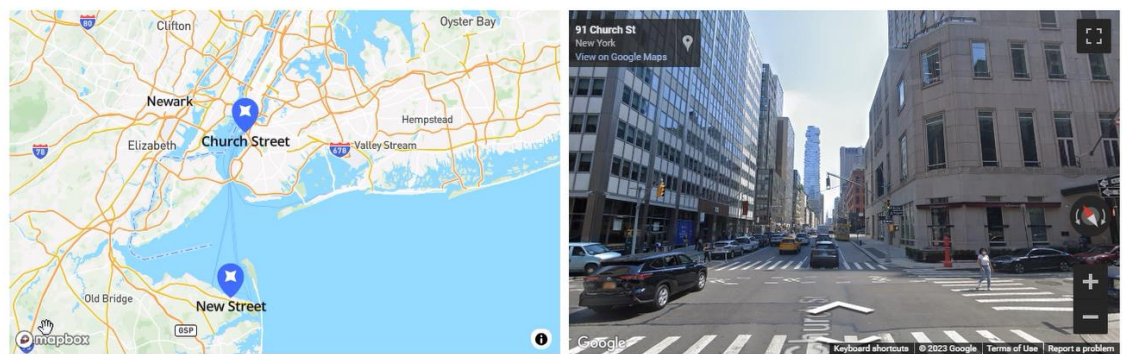

Legend

GeoJson file :

Choose File `geoJson.geoJson`

Submit

```
{ "x": 40.5, "y": 344 }
{ "lng": -74.44222703214541, "lat": 40.400896175101366 }
```

☐ Heat Map

- c. Once you click on the heatmap checkbox the point with their intensity value will be shown.

Legend

GeoJson file :

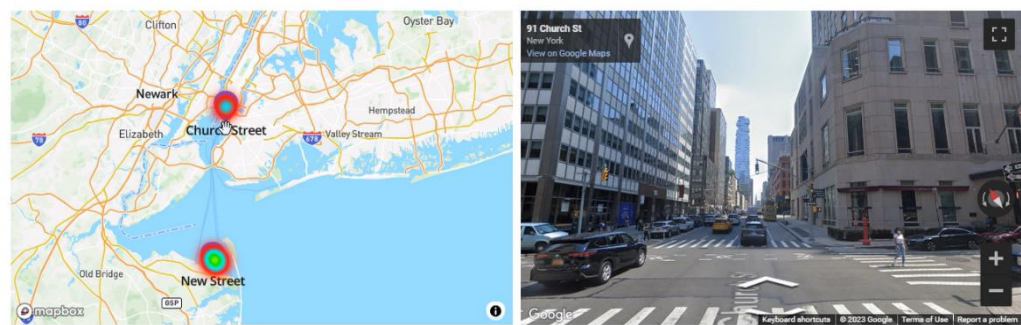

Choose File	geoJson.geoJson

Submit

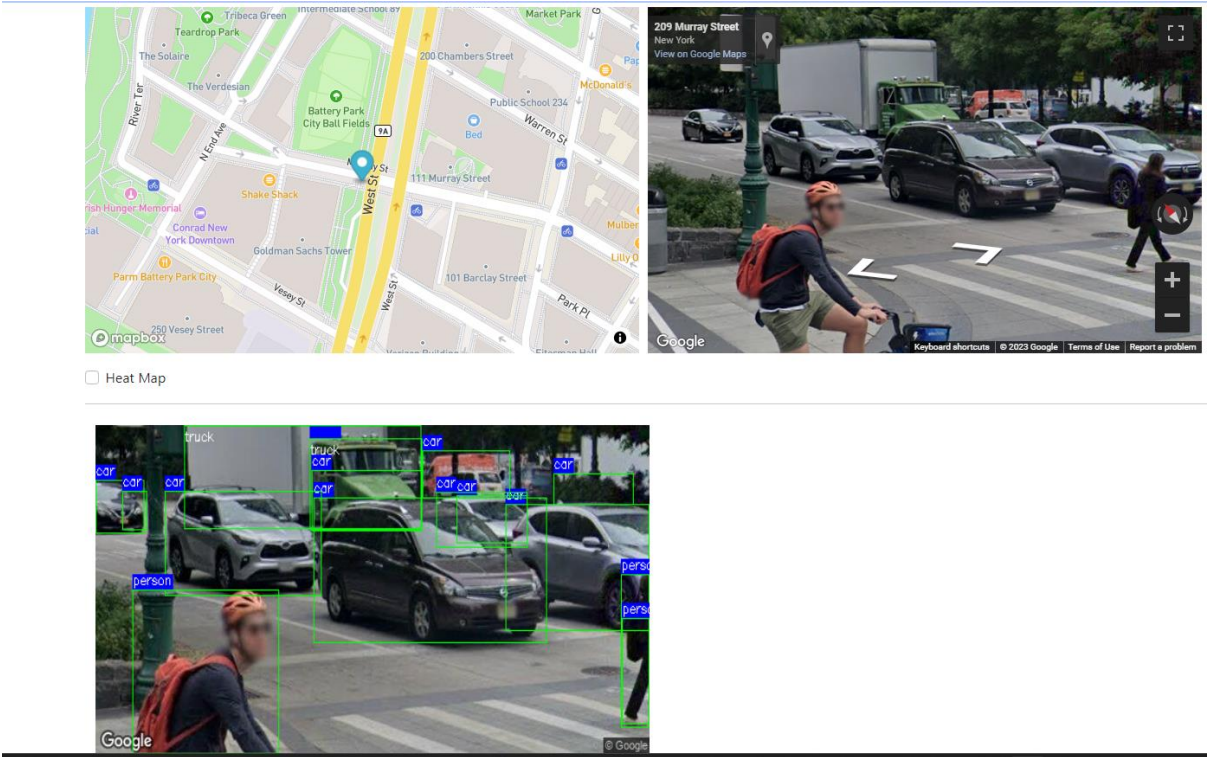

```

{"x":260.5,"y":150}
{"lng":-74.03523309003765,"lat":40.67364949346381}

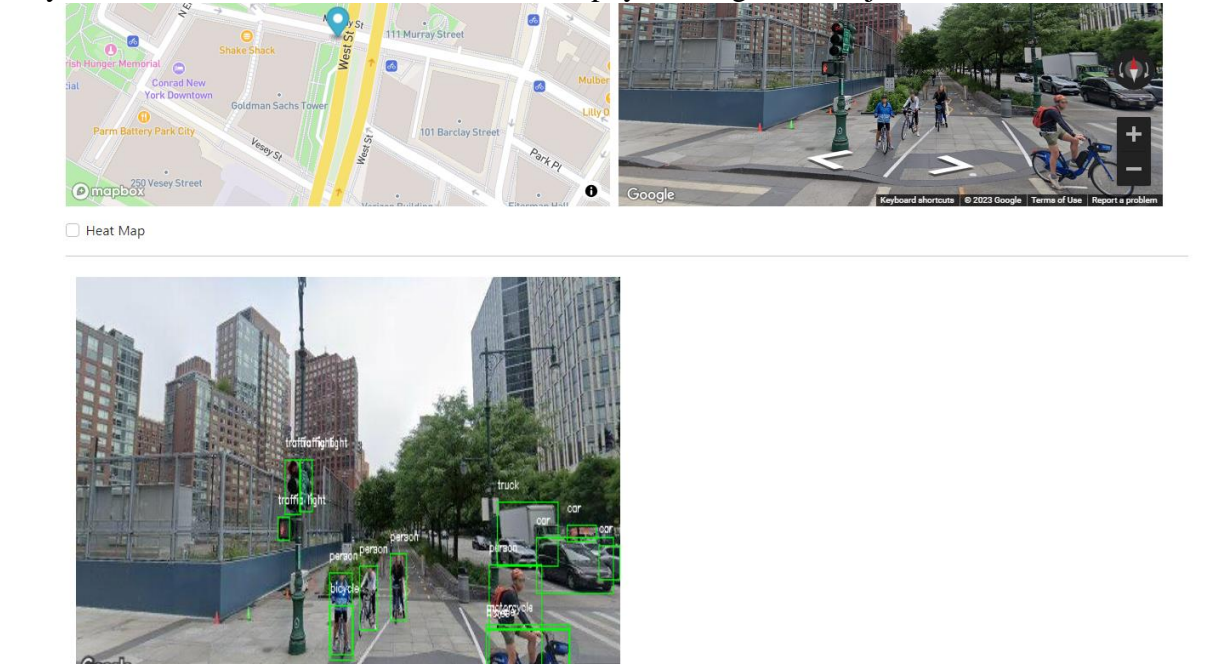

```

☒ Heat Map

- d. Live detection: As you move the street map the live object detection model start give details of objects.

As you move, zoom in zoom out the street map, you can get live objection detection.

Custom Knowledge base chatbot:

Technologies: Python, AWS, Langchain, LLAMA index, OpenAI, Machine Learning

Business Requirement:

The objective is to build a comprehensive platform that seamlessly integrates various technologies, including Python, OpenAI, and databases, to facilitate the creation, customization, and management of chatbots. The project entails building a user-friendly website with login and registration functionalities, subscription plans, and Stripe payment integration. The registration process involves an email verification system, and once logged in, users can access a personalized dashboard to view and modify their profiles, chatbots, and subscription plans. The system supports the creation of diverse chatbots, allowing users to input custom data through forms, upload files, and even integrate web crawling functionalities. The client seeks a robust administrative structure, with superadmin capabilities to oversee all bots and users. Additionally, there is a focus on OpenAI key management, allowing users to use their keys or default keys for bot training. The platform also addresses business-related aspects, including agency details, domain purchase integration, and Stripe account creation for managing chatbot subscription packages. The client emphasizes a thorough quality assurance process to ensure the reliability and effectiveness of the developed solution.

Features we have implemented:

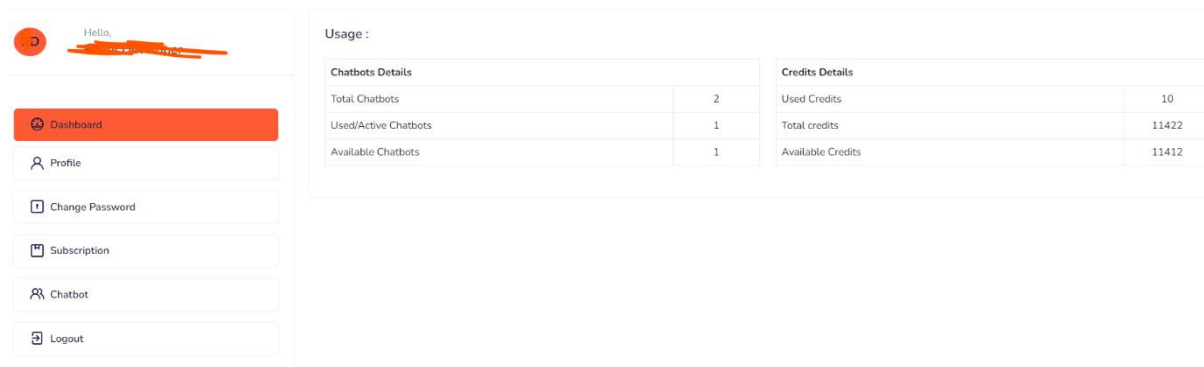

Website Landing Page:

User Registration:

User Login:

User Dashboard:

Created a user dashboard where users could view their profile, chatbots, subscription plans, change passwords, and upload profile pictures.

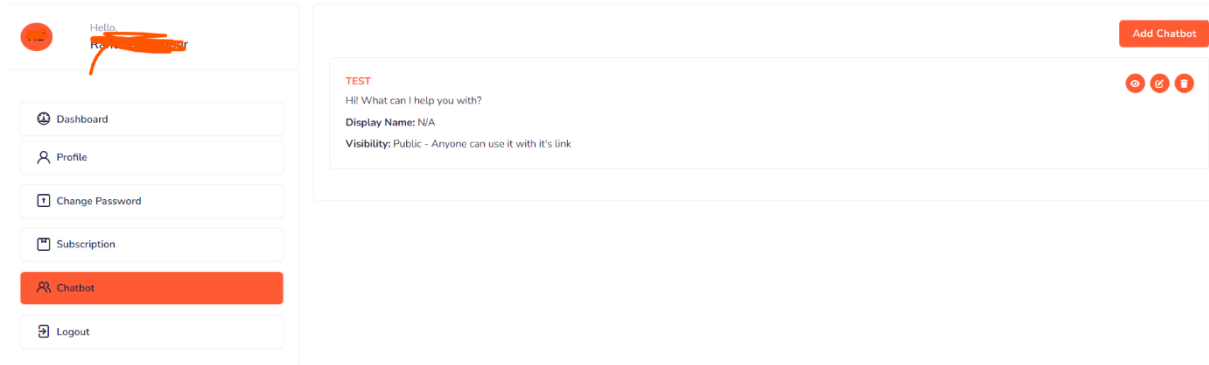

Chatbots Details		Credits Details	
Total Chatbots	2	Used Credits	10
Used/Active Chatbots	1	Total credits	11422
Available Chatbots	1	Available Credits	11412

Subscription Plans:

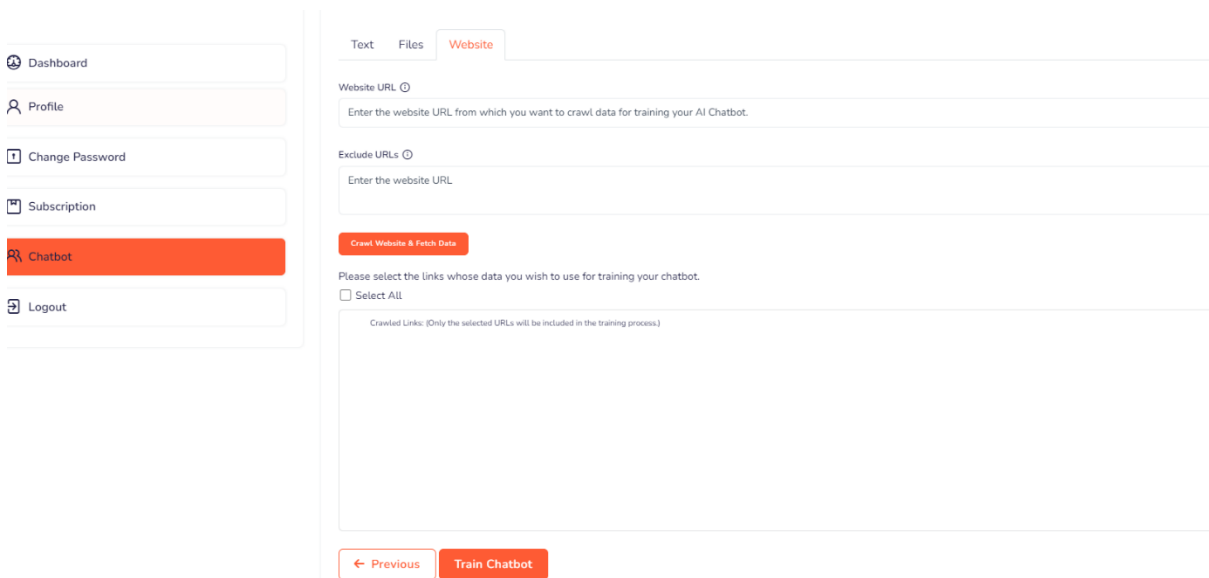

Bot Creation:

Developed a form for creating bots with fields like base prompts, radio buttons for public/private settings, numerical fields for bot temperature, and options for different types of API keys.

Bot Training:

Allowed users to upload PDF or DOCX files, provided website URLs for crawling, and updated training data. Users were able to edit details, add new data, and remove old training data.

Chatbot Customization:

Enabled users to customize their chatbots, including selecting colours, uploading logos, displaying pictures, and adding company names.

Customize your chat widget

AI story creation with Images

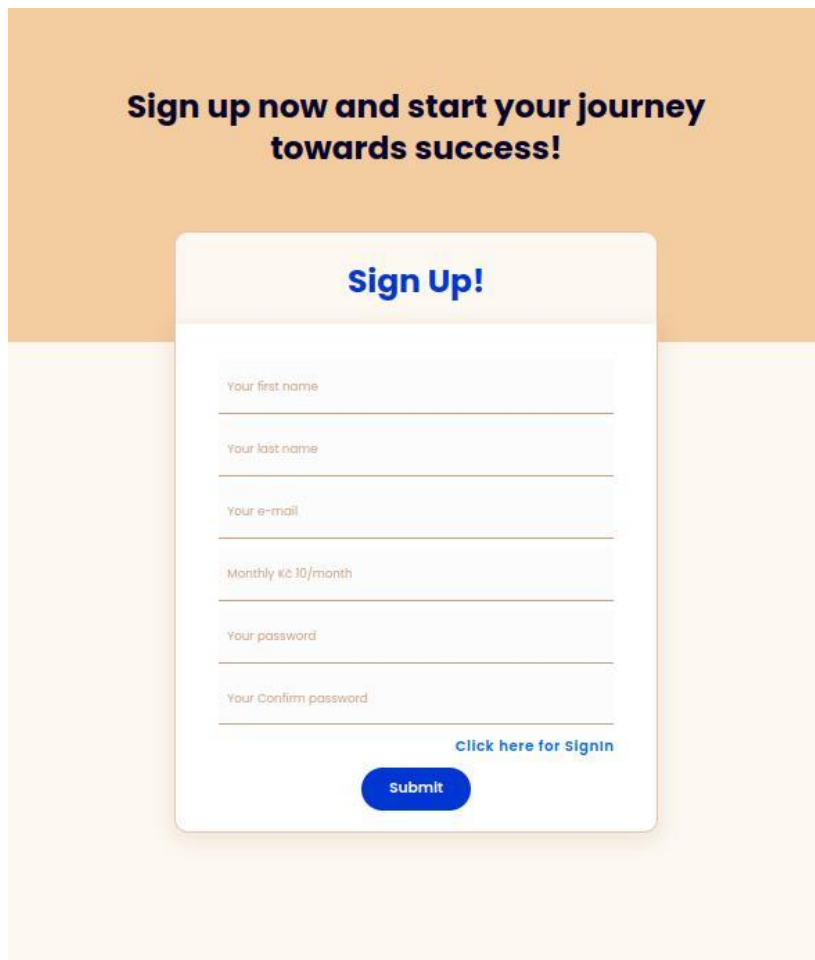

Technologies: Python, Image Library, Midjourney AI, OpenAI, Machine Learning

Business Requirement: The business requirements encompass the establishment of a secure user authentication system, inclusive of login and password retrieval functionalities. The user journey commences with a preliminary page providing a comprehensive introduction to the platform's purpose, complemented by a demonstrative feature allowing users to generate a single paragraph of a story. Subsequently, users may opt for monthly or annual subscriptions, seamlessly facilitated through a reputable payment gateway such as Stripe, to avail themselves of the story generation service. The system is designed to interact with ChatGPT for content creation, and it integrates to produce corresponding images.

Features we have implemented:

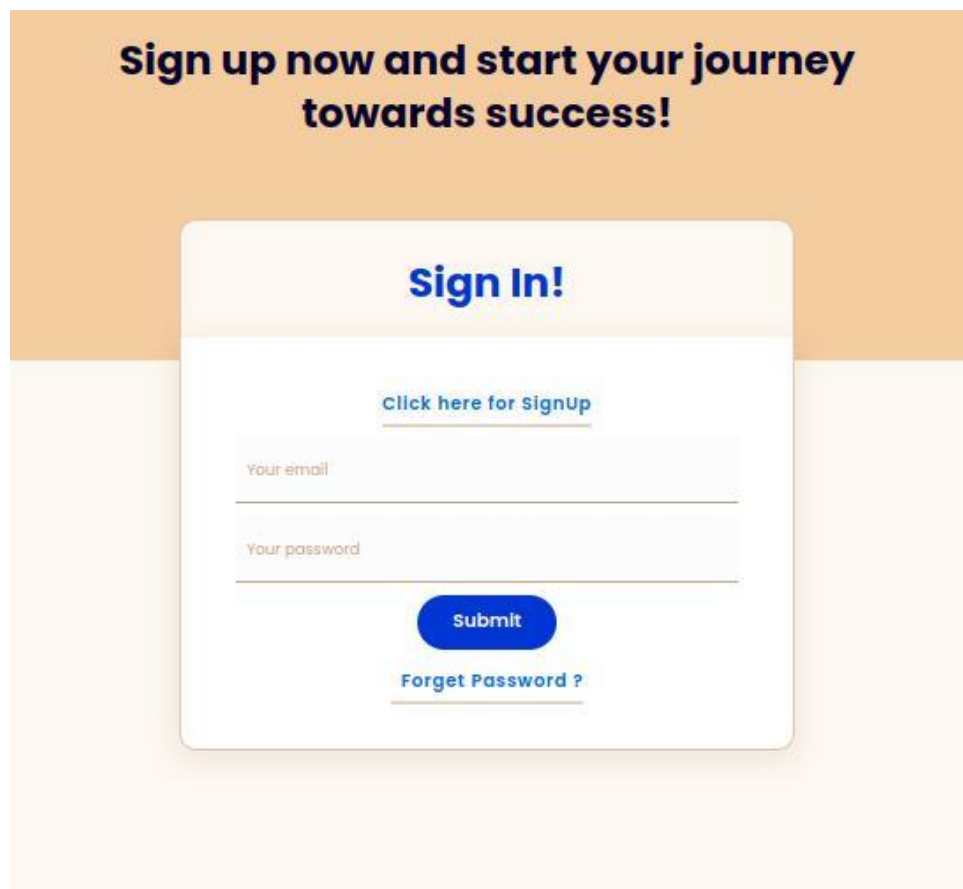

1. Login and Forgot Password Functionality:

- User authentication features, including the ability to log in securely and a mechanism for password recovery, have been implemented.

The image shows a 'Sign Up' form with a light orange background. At the top, the text 'Sign up now and start your journey towards success!' is displayed in bold black font. Below this, the form is titled 'Sign Up!' in blue. The form contains six input fields: 'Your first name', 'Your last name', 'Your e-mail', 'Monthly ₹6.10/month', 'Your password', and 'Your Confirm password'. A blue 'Submit' button is located at the bottom of the form. A link 'Click here for signin' is positioned above the button.

Sign in

Sign up now and start your journey towards success!

Sign In!

[Click here for signUp](#)

Your email

Your password

[Forget Password ?](#)

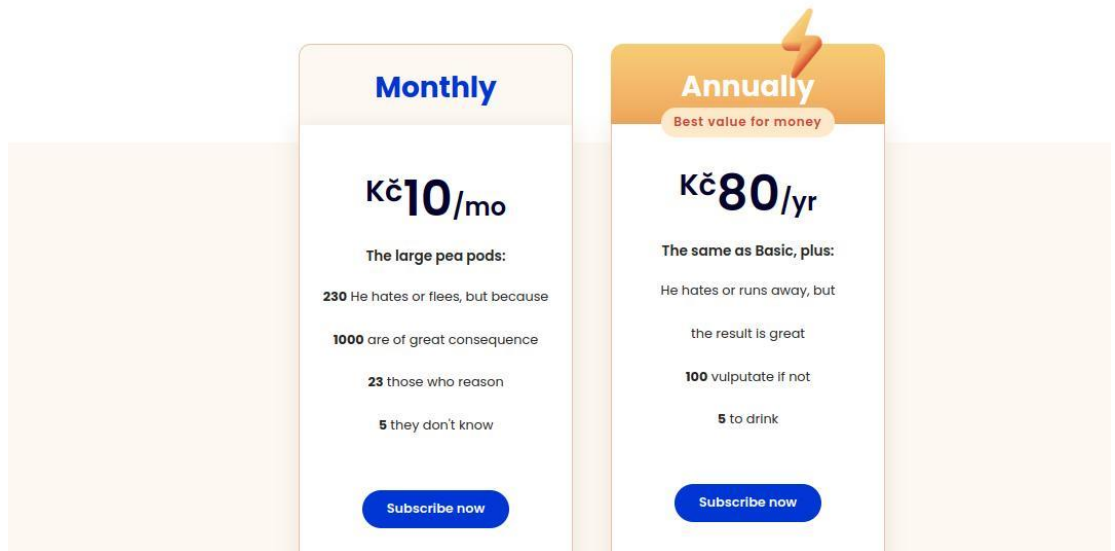

2. Subscription Management:

- Monthly/annually subscription options have been added, integrating with a payment gateway (e.g., Stripe) to facilitate recurring payments.

[Top](#) [Pricing](#) [Hardik Vinay](#) [Story Generate](#) [Log Out](#)

SUBSCRIPTION PLANS

Choose the best plan for your company.

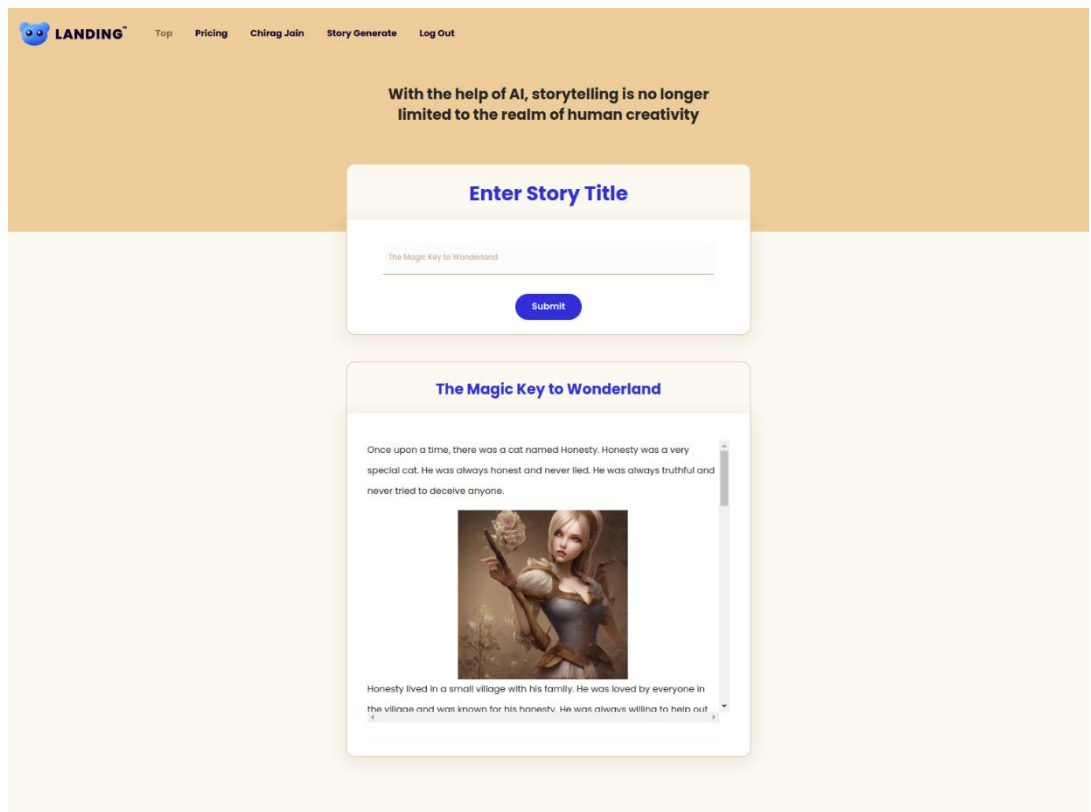

The image shows a comparison of two subscription plans: Monthly and Annually. The Monthly plan is priced at Kč10/mo and includes features like 'The large pea pods', '230 He hates or flees, but because', '1000 are of great consequence', '23 those who reason', and '5 they don't know'. The Annually plan is priced at Kč80/yr and includes features like 'The same as Basic, plus:', 'He hates or runs away, but', 'the result is great', '100 vulputate if not', and '5 to drink'. Both plans have a 'Subscribe now' button.

Monthly	Annually
Kč10/mo	Kč80/yr
The large pea pods:	The same as Basic, plus:
230 He hates or flees, but because	He hates or runs away, but
1000 are of great consequence	the result is great
23 those who reason	100 vulputate if not
5 they don't know	5 to drink
Subscribe now	Subscribe now

3. Data Submission for Story Generation:

- After subscribing, users can submit data to generate stories.

The image shows the 'Enter Story Title' form and the generated story content. The form has a text input field with the placeholder 'The Magic Key to Wonderland' and a 'Submit' button. The generated story is titled 'The Magic Key to Wonderland' and includes a paragraph of text and an image of a woman holding a key.

With the help of AI, storytelling is no longer limited to the realm of human creativity

Enter Story Title

The Magic Key to Wonderland

Submit

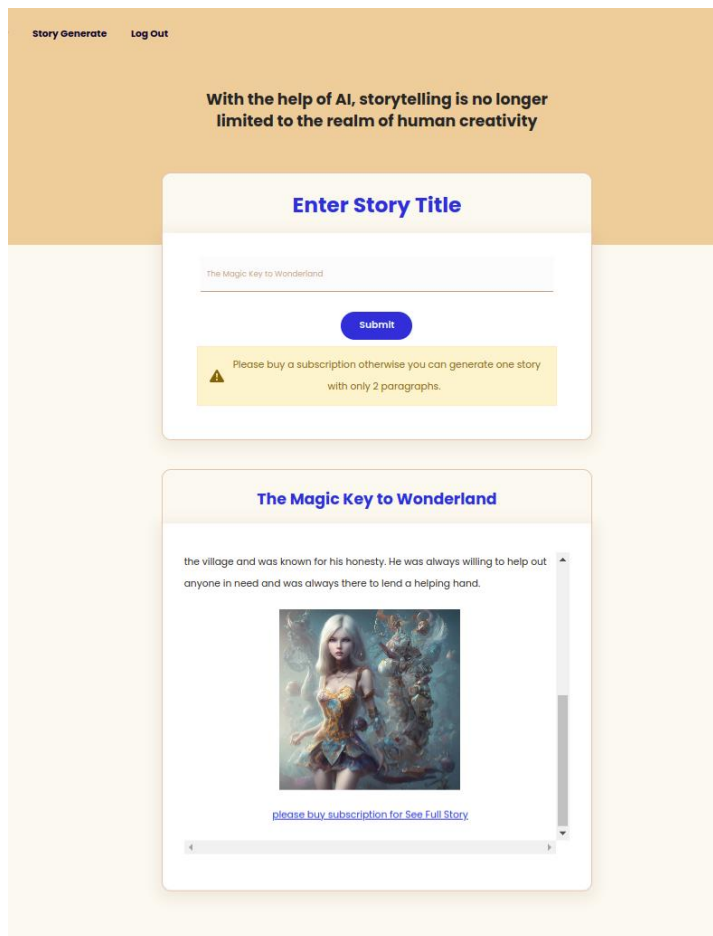

The Magic Key to Wonderland

Once upon a time, there was a cat named Honesty. Honesty was a very special cat. He was always honest and never lied. He was always truthful and never tried to deceive anyone.

Honesty lived in a small village with his family. He was loved by everyone in the village and was known for his honesty. He was always willing to help out.

For free user, they can generate one story only

The screenshot shows a web interface for generating stories. At the top, there are links for "Story Generate" and "Log Out". Below this, a message states: "With the help of AI, storytelling is no longer limited to the realm of human creativity". The main section is titled "Enter Story Title" and contains a text input field with the placeholder text "The Magic Key to Wonderland". A blue "submit" button is located below the input field. A yellow warning box with a triangle icon contains the text: "Please buy a subscription otherwise you can generate one story with only 2 paragraphs." Below this, the generated story is displayed under the title "The Magic Key to Wonderland". The story text reads: "the village and was known for his honesty. He was always willing to help out anyone in need and was always there to lend a helping hand." Below the text is a generated image of a young woman with long blonde hair, wearing a blue and gold outfit, standing in a fantastical, ethereal environment. At the bottom of the story section, there is a link that says "please buy subscription for See Full Story".

4. Story Generation:

- The system interacts with ChatGPT to generate stories based on user input.

5. Image Creation with Image library:

Social AI chatbot

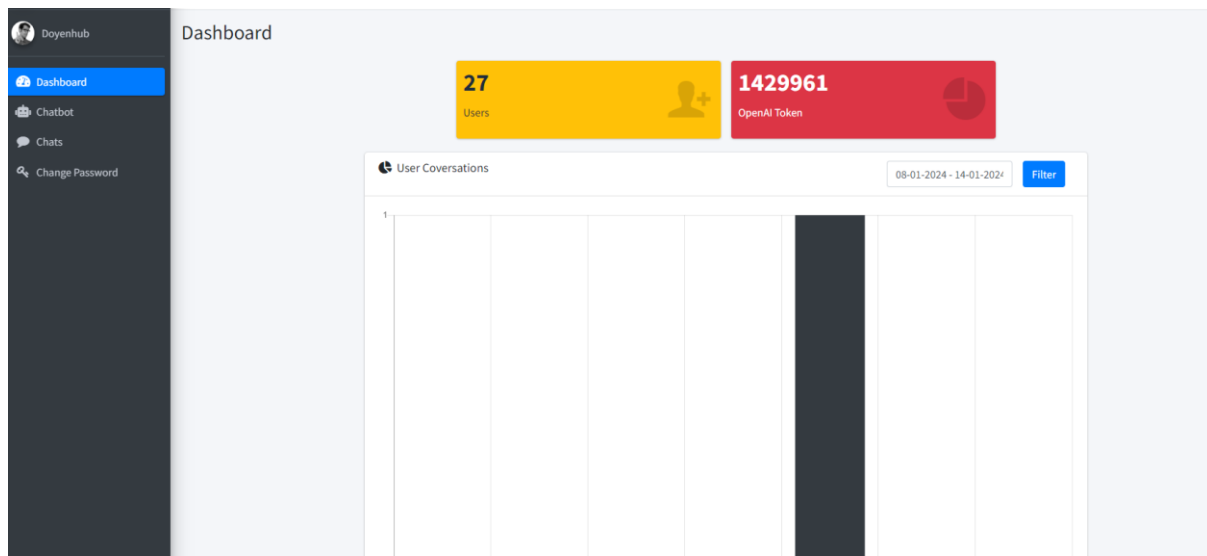

Technologies: Python, Laravel, OpenAI, NLP, Google Gemini pro, ChromaDB, Flask, Machine Learning AI.

Business Requirement: In this requirement client want to create a chatbot which use their portfolio documents (pdf, docx) to as custom data base and give the answers to user on chat. The backend can be OpenAI or Gemini must be fix from the frontend. Chatbot must have the intelligent memory for save the conversion.

Features we implemented:

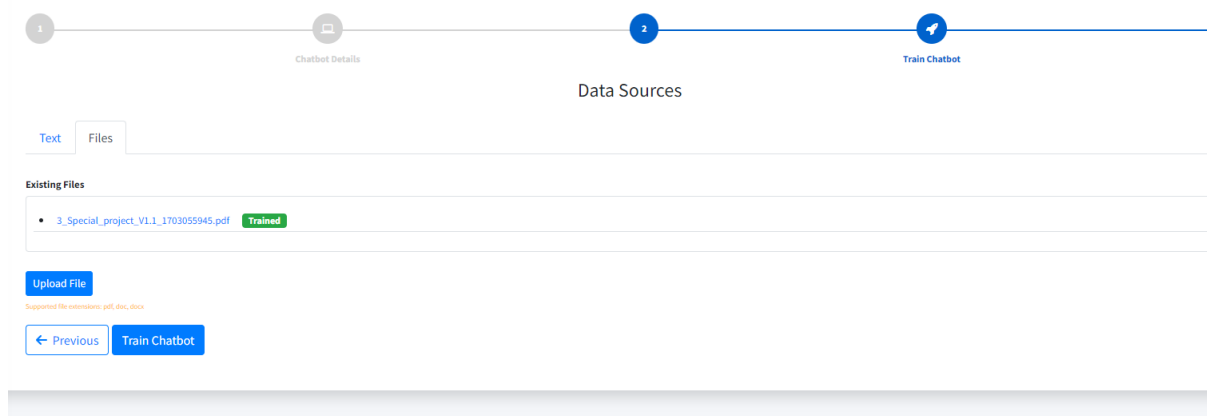

User Login:

User Dashboard:

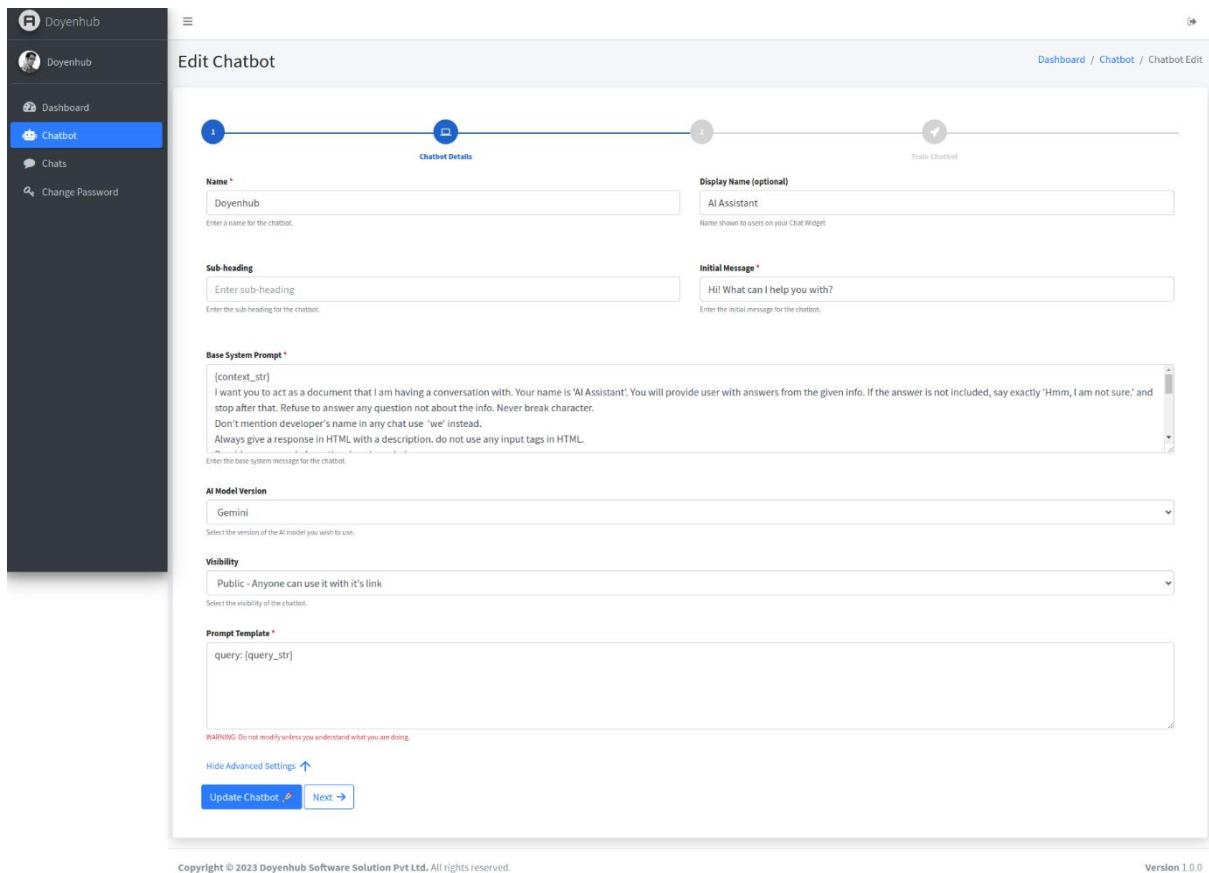

Bot Training:

Allowed users to upload PDF or DOCX files and plain text.

Chatbot Instruction:

User can set base template and prompt template and other fields.

Edit Chatbot

Dashboard / Chatbot / Chatbot Edit

1 Chatbot Details **2** Train Chatbot **3** Train Chatbot

Name *
Doyenhub
Enter a name for the chatbot.

Display Name (optional)
AI Assistant
Name shown to users on your Chat Widget

Sub-heading
Enter the sub-heading for the chatbot.

Initial Message *
Hi! What can I help you with?
Enter the initial message for the chatbot.

Base System Prompt *
[context_str]
I want you to act as a document that I am having a conversation with. Your name is 'AI Assistant'. You will provide user with answers from the given info. If the answer is not included, say exactly 'Hmm, I am not sure.' and stop after that. Refuse to answer any question not about the info. Never break character. Don't mention developer's name in any chat use 'we' instead. Always give a response in HTML with a description. do not use any input tags in HTML.
Enter the base system message for the chatbot.

AI Model Version
Gemini
Select the version of the AI model you wish to use.

Visibility
Public - Anyone can use it with its link
Select the visibility of the chatbot.

Prompt Template *
query: {query_str}

WARNING: Do not modify unless you understand what you are doing.

Integration of OpenAI and Gemini Pro.

The chatbot can take OpenAI turbo model as well as Gemini Pro. This customization can be done at frontend end. User can embed it other websites.

User can see chat history with time stamp.

22 Dec 2023

hi

12:24 PM

Hello! How can we assist you today?

give me this project you have done

12:25 PM

Hmm, I am not sure.

give me the list of project you have done

12:25 PM

1. Chatbot based on stored data

2. Stock Market Prediction Using AI/ML

3. DOYENHUB SOFTWARE SOLUTIONS

4. Project Manager Dashboard

5. ...

Anthropomorphic -AI Model Construction and Training

Technologies: Python, TensorFlow, NumPy, cv2, matplotlib pyplot, TensorFlow hub, torch, tqdm, PIL.

Business Requirement:

The main goal of this project is to develop an AI model capable of generating anthropomorphic portraits of pets based on user-uploaded photos. The generated images will depict pets' heads on human bodies, portraying them as noble figures, such as royalty, generals, or other themed characters. This tool aims to provide users with a fun and engaging way to create customized portraits of their pets.

Project Requirements and Features:

1) Desired Outcome:

- a. Users will upload a photo of their pet, and the AI will generate a portrait with the pet's head on a human body, ensuring a recognizable likeness to the uploaded photo.

2) Image Similarity:

- a. The AI-generated images must closely resemble the uploaded pet photos.

3) Model Training:

- a. Training the model to achieve desired results, with ongoing verification and retraining as needed.

4) Training Tutorial:

- a. Providing a video tutorial for the team on how to train the model.

5) User Volume:

- a. Accommodating up to 10,000 users generating images daily.

6) Training Data:

- a. Using approximately 1,000 pet photos, with each role requiring 500 training iterations.

NLP using Tensorflow.js

Technologies: React.js, TensorFlow.js, Node.js, Express.js, MySQL

Business Requirement:

This project involves developing a simple Question Answering (QA) system that uses a pre-trained model from TensorFlow to answer user queries based on a provided text passage. The text is fetched from a backend server and used as the source for answering questions. The system is designed to assist users in retrieving relevant answers quickly and efficiently.

Features Implemented:

1. Model Loading:

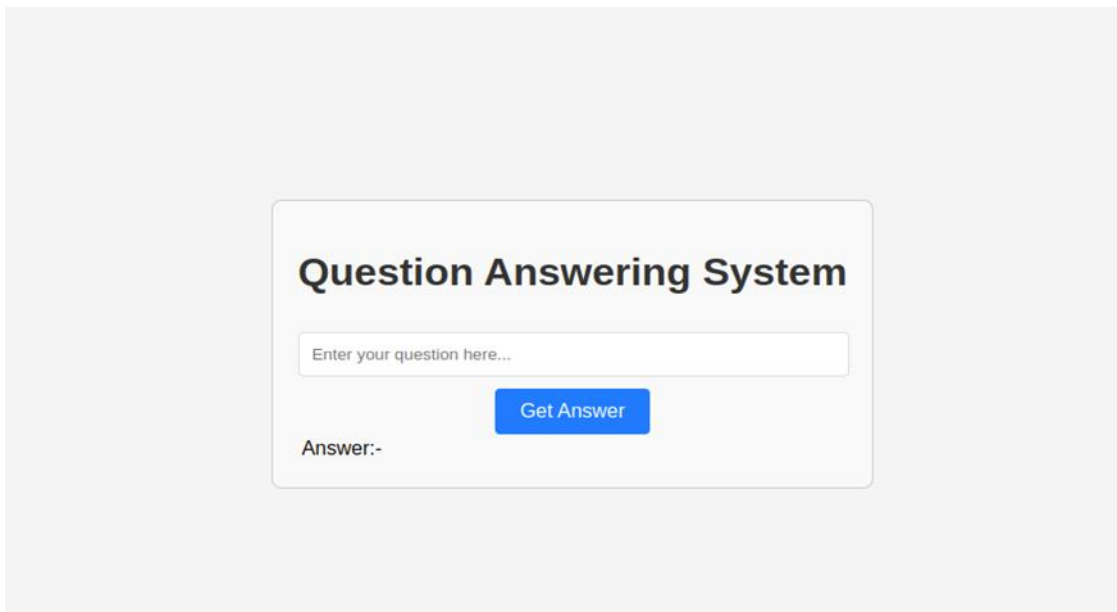

- a. A specialized Question Answering model is loaded from TensorFlow when the page first loads.
- b. The model leverages WebGL for enhanced processing speed, utilizing the computer's graphics card.

2. Text Fetching:

- a. The system fetches a passage of text from the backend API
- b. The text is processed and combined into a single passage to facilitate easier and more effective answer searching.

3. Answering Questions:

- a. Users can input their questions, and upon clicking the "Get Answer" button, the system searches the passage for the most relevant answer.
- b. The result is then displayed to the user. If the system fails to find an answer or encounters an error, an appropriate message is shown.

The screenshot shows a web interface for a "Question Answering System". It features a title "Question Answering System" in bold black text. Below the title is a text input field with the placeholder text "Enter your question here...". To the right of the input field is a blue button with the text "Get Answer". Below the input field and button is the label "Answer:-". The entire interface is contained within a light gray rounded rectangle on a white background.

Object Detection Model Using TensorFlow.js

Technologies: React.Js, TensorFlow.js.

Business Requirement: **object detection** is a computer vision task that involves identifying and locating objects within an image. Each detected object is usually surrounded by a bounding box and is labeled with a class name.

The object detection model using React.js allows developers to integrate object detection capabilities into their web applications. By leveraging TensorFlow.js and pre-trained models like Coco-SSD, this implementation enables real-time identification and classification of objects within images.

Features we have implemented:

- **Real-time Object Detection:** Detects objects within images and displays bounding boxes around them.
- **Pre-trained Models:** Utilizes the Coco-SSD model, pre-trained on the COCO dataset, which recognizes 90 common object categories.
- **Customizable:** The model can be customized and extended with additional classes or integrated with other machine learning models.
- **Cross-Platform:** Works in any modern web browser, leveraging TensorFlow.js for running machine learning models in the browser.
- **Ease of Integration:** Seamlessly integrates with React.js applications.
- **No Backend Required:** Everything runs in the browser, eliminating the need for server infrastructure.
- **Offline Support:** One major advantage is that TensorFlow models can be run **offline** on local machines or edge devices. After downloading and integrating the model, it does not require continuous internet access, making it ideal for environments with limited or no connectivity
